ELECTRICAL ADJUSTMENT

Circuit adjustments become necessary, in most cases, due to the wear of mechanical parts or following the replacement of critical components such as the video head. Certain circuit defects can often cause circuit adjustments to vary considerably. Should this occur, be sure to determine the nature of the defect and repair prior to proceeding with adjustments.

Always use the test equipment recommended for a give adjustment procedure. If the appropriate test equipment is not available, it is recommended that adjustments NOT be attempted. Refrain from the indiscrete adjustment of circuit adjustment controls unless properly equipped to do so.

MECHANICAL ADJUSTMENT AND REPLACEMENT

1. Cleaning of Deck

The following parts require cleaning whenever serviced to maintain satisfactory performance.

1-1 Video Head

A. Clean the video heads in the following method if dust and other foreign objects on the video heads disturb the normal playback of images:

Dampen video head cleaning cloth with alcohol. Hold the cloth against the drum and turn the drum slowly counterclockwise to clean.

Note:

Do not directly touch the head attached to the upper drum. The head is very hard but brittle to impact, especially in the vertical direction.

Do not apply force in the vertical direction.

B. Allow residual alcohol to dry thoroughly before running tape. Otherwise, the liquid may stick to and damage the tape.

8. Upper and lower drum
9. Takeup slant pole
10. Takeup guide roller
11. A/C head
12. Takeup guide pole
13. Pinch roller
14. Capstan shaft
15. Takeup guide arm
16. Tension regulation arm T

A. Clean the tape transport with gauze dampened with alcohol, except the supply guide roller, takeup guide roller and pinch roller. If Guide rollers and pinch roller are stained with dust, clean them with dry gauze or exchange them with new parts.

B. Allow residual alcohol to dry thoroughly before running a tape. Otherwise the liquid may stick to and damage the tape.

- Note:**
In this case the tape guide should be replaced with a guide which has less inclination.
- Record(or Play back) an blank tape (E-120) in SP mode. See if the tape is drifting on takeup guide pole. If so, repeat Adjustment of A/C Head Slant (item 3-3-1) to avoid tape drifting.
 - On completion of the above adjustment,adjust phase as in 3-4.

3-3-3 Replacement of Tape Guides

- A. Identify the Item Number of the Tape Guide to be replaced. This is done by observing the marking present on the die-cast portion of the Tape Guide base, and comparing that marking to Fig. 3-3-4.
- B. If the Item Number of the tape guide presently installed is a '3', replace the guide with an Item Number '1' guide.
- C. If the Item Number of the present tape guide is a '1', replace the guide with an Item Number '2' guide.
- D. If the Item Number of the present tape guide is a '2', replace the guide with other Item Number '2' guide.
- E. Once the tape guide is replaced, resume alignment starting with 3-2-1.

3-4 Phase Adjustment(Refer to Fig. 3-4.)

- A. Play back an alignment tape. (PM3KE6 (CH 1) 25, Part No. 859C568O50)
- B. Pull, rotate and set TRACKING knob at the center click position.
- C. Turn the phase adjusting nuts to make the amplitude of the FM waveform maximum.
Note:
Do not turn the phase adjusting nut more than one turn in either direction.
- D. Turn the A/C head counterclockwise and return to make sure that the amplitude of the FM waveform is the same as that before turning the head.
- E. If the amplitude changes, check the A/C arm shaft if loose. If not free, replace the A/C arm and adjust the A/C head as in 3-3 and the phase as in this section from beginning.
- F. Load and unload the tape several times to make certain that the amplitude of the FM waveform does not change.

3-5 Adjustment of Takeup Guide Arm Height (Refer to Fig. 3-5.)

- A. Run a final portion of E-240 blank tape in the reverse search mode.
- B. Adjust the height of the takeup guide pole by turning the height adjusting nut so that the tape shall not be creased at the upper and the lower flange portion of the take up guide pole.
Note:
Set the adjusting nut in the screwing-in direction.
Do not turn the nut more than one turn in either direction.
- C. Eject the cassette tape and set to the reverse search mode again to make certain that the tape is not creased at the upper and the lower flange portion of the takeup guide pole.
- D. Set to the playback mode and be sure that the tape is not creased at the upper and the lower flange portion of the takeup guide pole.

CHIP PARTS REPLACEMENT

CHIP PARTS REPLACEMENT

Some resistors, shorting jumpers (0Ω resistor), ceramic capacitors, transistors and diodes are chip parts which are used for certain circuit elements. When replacing these parts, note the cautions as follows.

Cautions:

- Use fine tipped, well insulated soldering pencil (iron) about 30 watts and the tweezers.
- Melting the solder, remove the Chip Parts carefully not to tear off the copper foil of the printed circuit board.
- Discard removed chips; do not reuse them.
- Do not apply heat for more than 3 seconds to the new chip Parts.
- Avoid using a rubbing stroke when soldering.
- Take care not to scratch when soldering, or damage the Chip Parts.
- Supplementary cementing is not required.

1 Removal of chip Parts

(Resistors, capacitors, etc.)

- Grasp the part with tweezers. Melting the solder at both side alternately, remove the one side of the part with a twisting motion.
- Melt the solder at the other side and remove the part.

Fig. 1

2 Removal of Chip Parts (Transistors)

- Melting the solder of one lead, Lift the side of that lead upward.
- Simultaneously melt the solder of the two remaining leads and lift the part to remove.

Fig. 2

3 Replacement

- Presolder the contact points of the circuit pattern.
- Press the part downward with tweezers and apply the soldering pencil as shown in the figure.

PCB-BLOCK DIAGRAM

NOTE 1:

1. DC voltages were measured from points indicated to the circuit ground with a digital voltmeter.
2. The voltages parenthesised are on SP recording mode. While those without parenthesised on SP play back mode.

NOTE 2:

1. The unit of resistance "ohm" entirely omitted. Accordingly, K = 1000 ohms M = 1000K ohms.

2. The wattage of resistor, not specifically designated, is 1/4 watt except CHIP resistors.
3. Resistors, not specifically designated, are carbon resistors except CHIP resistors.

4. The marks of resistors are as follows.

- CE : Cemented resistor
 MB : Metal oxide film resistor (type B)
 S : Fixed composition resistors
 W : Wire wound resistor
 M : Metal film resistor

5. The tolerance of resistor value, not specifically designated, is: $\pm 5\%$, K = $\pm 10\%$ M = $\pm 20\%$

6. The unit of capacitance, not specifically designated, is:

- a) μF , for numbers less than 1
 b) PF, for numbers more than 1

7. Capacitors, not specifically designated are Ceramic capacitors except electrolytic capacitors.

8. The marks of capacitors are as follows:

- ALM : Aluminum electrolytic capacitor
 MF : Polyester capacitor
 PP : Polypropylene film capacitor
 TAN : Tantalum capacitor
 SC : Semiconductor Ceramic Capacitors
 TF : Twin film capacitor
 NP : Non polarized electrolytic capacitor

* : Electrolytic capacitor

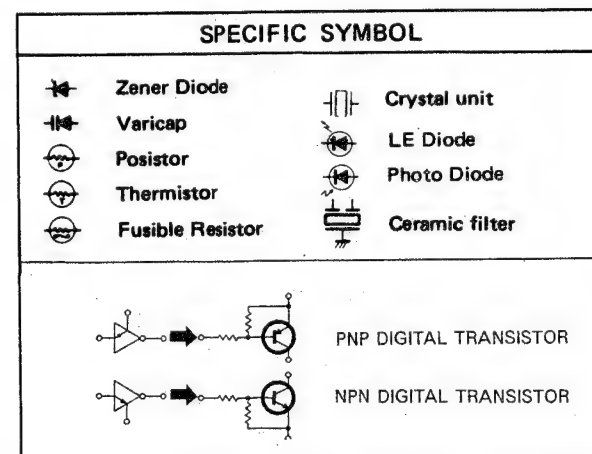

9. The DC working voltage of capacitor, not specifically designated is: 50V

10. The tolerance of capacitor value, not specifically designated is: $\pm 10\%$

and J = $\pm 5\%$ K = $\pm 10\%$ M = $\pm 20\%$ P = $\pm 100\%$

C = $\pm 0.25PF$ D = $\pm 0.5PF$ F = $\pm 1PF$ Z = $\pm 30\%$ N = $\pm 30\%$

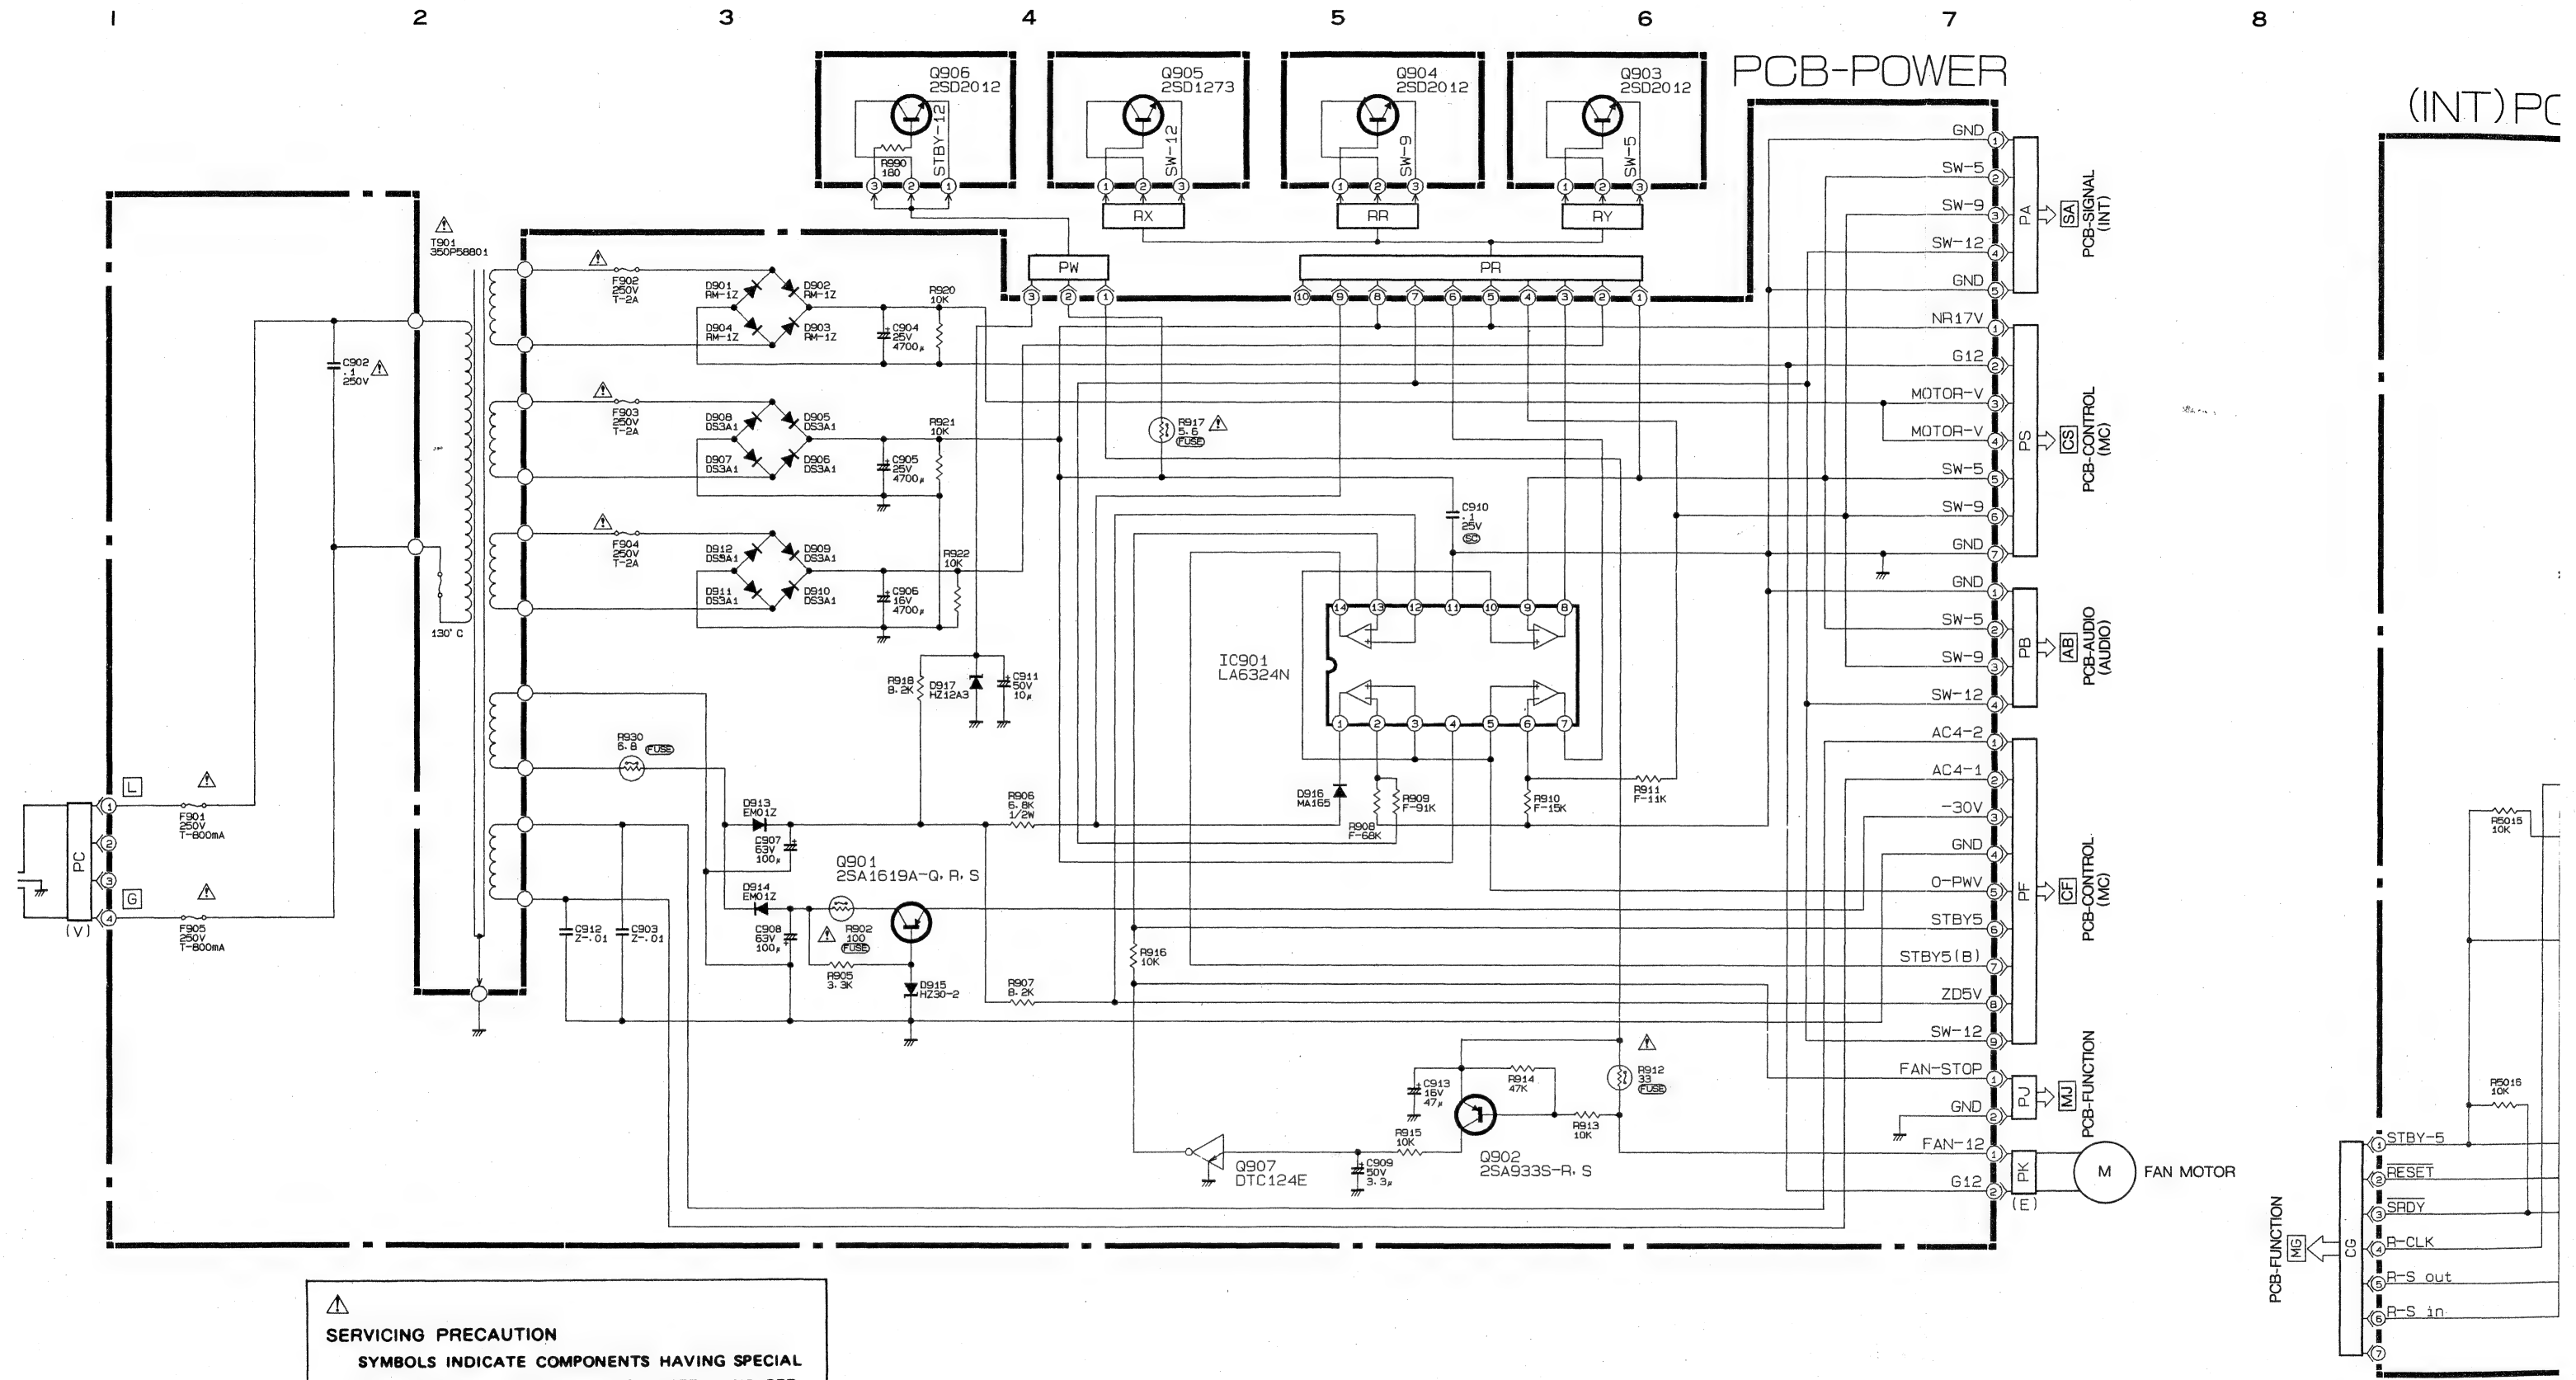

11. Ceramic capacitors with the marks RH, UJ, SL, etc. are temperature compensating types.

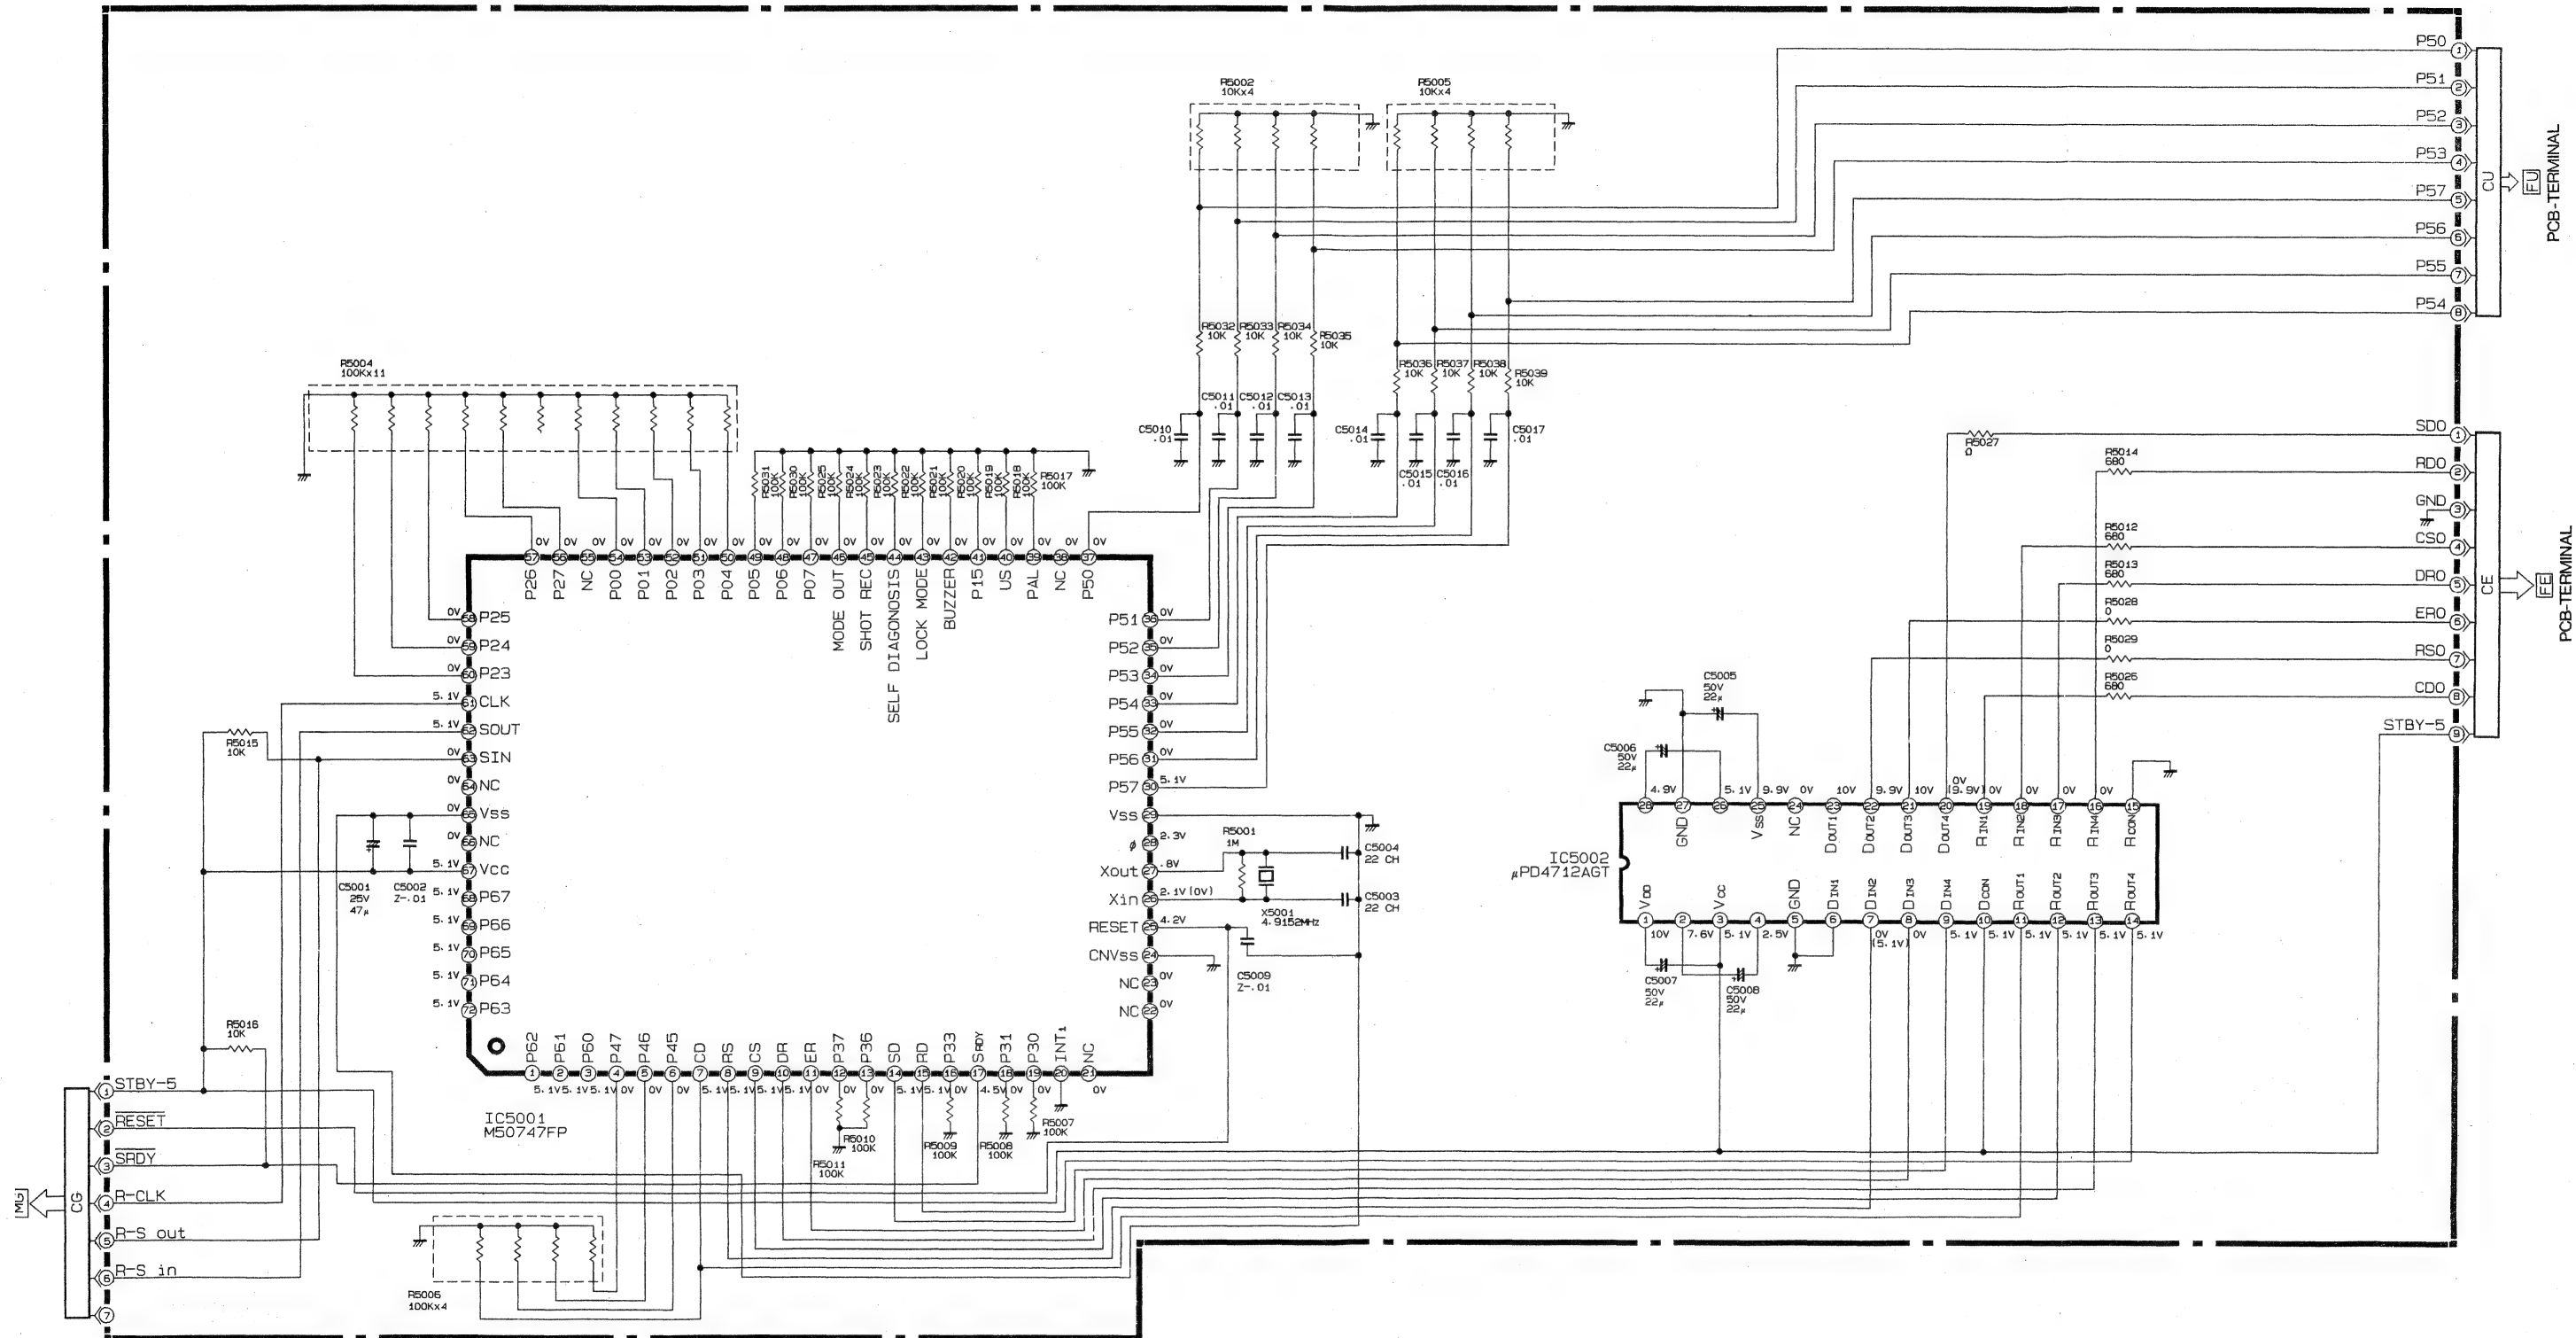

This is a basic schematic diagram. Some sets may be subject to modification according to engineering improvement.
